ArcGIS Pro Essentials Training Course for Engineers and Planners

Ref: 161_4549 **Date:** 29 August – 2 September 2027 **Location:** Online **Fees:** 2900 GBP

ArcGIS Pro Essentials for Engineers and Planners is a 1-week training course for new GIS users, engineers, planners and data analysts, and it ends with a finished map layout backed by an edited geodatabase. Engineering and planning offices now receive more location data from surveys, utilities and open portals than they can read without a desktop GIS. Jupiter Prime Training introduces ArcGIS Pro Essentials for Engineers and Planners as a practical first route into structured, presentable spatial work.

Why ArcGIS Pro Essentials for Engineers and Planners Matters Now

Three changes push engineers and planners towards ArcGIS Pro today. Organisations are moving from older desktop mapping tools to a single project-based environment; clients and approval bodies expect site plans, constraint maps and asset layers delivered as clean, consistent maps; and colleagues share layers through portals, so a newcomer must open, edit and return data without breaking it. A team where several members handle basic mapping confidently spends less time waiting on one specialist. One that does not keeps sending simple map edits to an overloaded GIS unit and issues maps with mismatched symbols and missing legends.

Who Gains Most from ArcGIS Pro Essentials for Engineers and Planners

- Engineers who need site, route or asset maps for design reports
- Planners who prepare zoning, land-use and constraint maps for applications
- Analysts who join tables to locations and summarise them on maps
- Technical staff who edit utility, parcel or facility layers held by the office
- Newcomers to GIS who inherit projects created by former colleagues

An engineering or planning office gains most when two or three non-specialists attend together and agree a shared project template and symbol set afterwards.

ArcGIS Pro Essentials for Engineers and Planners Capabilities

Participants leave the course able to open, organise, edit and present spatial data in ArcGIS Pro without relying on a GIS specialist for routine maps.

- Build an ArcGIS Pro project with maps, folders and database connections — office project leads
- Apply symbology, labels and scale ranges that read clearly — map readers and approvers
- Design a simple file geodatabase with feature classes and domains — data owners
- Test edits with snapping, attribute rules and undo history — asset and parcel custodians
- Calculate buffers, clips and summaries with core geoprocessing tools — engineers and planners
-

Communicate findings through layouts with legends, scale bars and north arrows — clients and approval panels

Key ArcGIS Pro Essentials for Engineers and Planners Terms

- Project — the ArcGIS Pro file that holds maps, layouts, toolboxes and connections for one piece of work.
- Feature Class — a set of points, lines or polygons of one type stored in a geodatabase.
- Symbology — the colours, sizes and symbols that show what each feature or value represents on the map.
- File Geodatabase — a folder-based database storing feature classes, tables and rules for a project or team.
- Geoprocessing Tool — a command that takes input layers and produces a new output, such as a buffer or clip.
- Layout — a page design combining map frames, legends, titles and scale bars ready for printing or PDF.

ArcGIS Pro Essentials for Engineers and Planners Day by Day

Day 1: Projects, Maps and Data Sources

- ArcGIS Pro Interface and Ribbon — Finding Tools Quickly for Daily Tasks
- Project Structure and Catalog Pane — Organising Folders and Connections
- Adding Layers From Files and Portals — Choosing Reliable Data Sources
- Coordinate Systems on the Map — Keeping Layers Aligned Correctly
- Attribute Tables — Reading and Filtering Feature Information

Day 2: Symbology and Labelling

- Single and Unique Value Symbols — Showing Categories Such as Land Use
- Graduated Colours and Sizes — Displaying Quantities Such as Population
- Label Classes and Placement — Keeping Text Readable at Each Scale
- Scale Ranges and Group Layers — Controlling What Appears When
- Layer Files and Style Reuse — Sharing Consistent Symbols Across Projects

Day 3: Geodatabases and Editing

- File Geodatabase Creation — Setting Up Feature Classes and Tables
- Fields and Domains — Limiting Entries to Valid Values
- Creating and Reshaping Features — Digitising Parcels, Pipes and Roads
- Snapping and Editing Templates — Keeping New Features Connected
- Attribute Editing and Field Calculator — Filling Values Efficiently

Day 4: Core Geoprocessing Tools

- Select by Attribute and Location — Isolating Features for Study
- Buffer and Clip — Defining Setbacks and Study Areas
- Spatial Join and Summary Statistics — Counting Features per Zone
- Table Joins and Excel Imports — Linking Spreadsheets to Locations
- Geoprocessing History — Rerunning and Documenting Tool Steps

Day 5: Practising the Map Layout and Edited Geodatabase

- Sample Data Preparation — Applying Project Structure and Coordinate Checks
- Feature Editing Session — Applying Domains and Snapping to Real Edits
- Constraint Map Build — Applying Buffers, Clips and Symbology
- Layout Elements — Adding Legends, Scale Bars, North Arrows and Titles
- Finished Map Layout With Edited Geodatabase — Completing the Work Product

Applying ArcGIS Pro Essentials for Engineers and Planners After the Course

- Set up an office project template with folder connections, a basemap and saved layer files for the next site or planning study
- Digitise or update one asset or parcel layer in a file geodatabase using domains and snapping, then issue a layout to the project team

ArcGIS Pro Essentials for Engineers and Planners Questions FAQ

What is ArcGIS Pro Essentials for Engineers and Planners and why does it matter now?

ArcGIS Pro Essentials for Engineers and Planners is a foundation in building projects, symbolising layers, editing geodatabases and producing layouts. It matters now because offices are moving to ArcGIS Pro and need more staff who can handle routine mapping.

Which roles gain most from ArcGIS Pro Essentials for Engineers and Planners?

New GIS users, engineers, planners and data analysts gain most. They prepare site, constraint and asset maps for reports and applications and need to edit and present office data confidently.

How does ArcGIS Pro Essentials for Engineers and Planners differ from an advanced spatial analysis course?

It builds core skills in projects, symbology, editing and layouts rather than advanced modelling. An advanced course automates geoprocessing and designs enterprise databases; this course gives newcomers a reliable everyday workflow.

What do you bring back from ArcGIS Pro Essentials for Engineers and Planners?

You bring back a finished map layout with an edited geodatabase, plus a project structure, layer files and symbology you can reuse on your next study.

ArcGIS Pro Essentials for Engineers and Planners: The Way Forward

The finished map layout with an edited geodatabase first informs how your office sets up its next mapping job: which template, symbols and data sources to use. Engineers, planners and project leads use it as a reference. After its first reuse, revisit the domains and layer files, since new projects reveal which values and symbols need adding.
